DEVICE TEST

1, Explain behaviour of hub device

- * Hub is broadcast device, collision ^{is high}
- * It works in layer 1 of a network
- * It is used to connect multiple network devices
- * It is half duplex $\rightarrow$ means one communication at a time

2, Explain behaviour of switch device

- * It is also broadcast device but it do address learning and works as ~~unique~~ cast device, if the mac address ^{port is known}
- * broadcast + unique = Intelligent device
- * It works in the layer 2, It has mac table (mac no + ^{order} port)

3, Explain behaviour of router device

- * It is a ~~unique~~ cast device
- * It works on layer 3 of network, layer 3 device
- * It is used break the broadcast domain
- * It contains routing table
- * Routing table has a list of routes to reach same and different network ~~different~~
- * main purpose of router is to connect different ~~different~~ networks
